

JAR ASSIGNMENT

Question 2

App Exploration:

What Works Well

1. **Minimum buying price of ₹10**

Jar allows users to start investing in gold with as little as ₹10, making it extremely affordable and accessible for students, beginners, and individuals with low income. This low entry barrier encourages consistent saving habits.

2. **Autopay for daily, weekly, or monthly savings**

The app provides an automatic savings feature where users can schedule regular investments. This helps in building disciplined financial habits without requiring manual effort.

3. **Live gold price and transparent buying interface**

Jar shows real-time gold prices and displays how much gold the user receives for the amount invested. This transparency increases trust and helps users make informed decisions.

4. **Instant saving option (2–3 step gold purchase)**

The app offers a simple and fast gold-buying process. Users can purchase gold instantly in just a few steps, making the experience smooth, quick, and user-friendly.

5. **Cashbacks and offers on gold purchases**

Jar frequently provides cashback rewards and promotional discounts. These incentives motivate users to buy gold regularly and enhance the overall saving experience.

Areas for Improvement

1. **Regulatory clarity and risk disclosure**

Since digital gold is not regulated by SEBI or RBI, users may be unsure about safety, protection, and storage. The app should clearly explain risks, custodians, and insurance coverage to improve trust.

2. **Fee transparency and hidden costs**

Some users find it difficult to understand the exact charges, including buy-sell spreads, storage fees, and GST. Jar should provide a clear cost breakdown before every transaction.

3. **User interface could be improved**

The design and layout can feel cluttered or confusing at times. A cleaner and more intuitive interface would make navigation easier, especially for new users.

4. **Some options are not easily understandable**

Certain features such as vault details, withdrawal rules, and gold conversion are not clearly explained. Adding tooltips, simple language, and step-by-step guides would make these features more accessible.

5. **Round-off feature not usable at the right time**

The round-off saving option appears only after the payment is completed, which reduces its usefulness. Showing the round-off option **during** money transfers or while paying bills would make this feature more practical and user-friendly.

Question 3:

Product Exploration

1. Diversify into Other Digital Assets (Silver, Mutual Funds, and ETFs)

Jar can expand its offerings beyond digital gold by introducing investments in digital silver, low-risk mutual funds, and exchange-traded funds (ETFs). This diversification allows users to invest small amounts (₹10–₹50) into multiple asset classes while using the same simple automated investment system.

2. Loan Against Invested Gold

Jar can introduce a “loan on gold balance” feature, where users can borrow small amounts instantly using their digital gold as collateral. These micro-loans can have low interest rates, quick approvals, and flexible repayment options.

3. Tie-Up With Other Payment Platforms for Round-Off Savings

Jar can collaborate with payment platforms like PhonePe, Google Pay, Paytm, or UPI apps to enable real-time round-off savings. Each time a user makes a payment, the leftover change (e.g., ₹152 → ₹160) can be automatically invested into gold or other assets.

4. Short-Term Goal-Based Savings (Education, Travel, Personal Purchases)

Jar can introduce a feature where users create personalized saving goals such as buying a phone, travel, festival shopping, or education-related expenses. The app can automatically invest daily/weekly amounts toward these goals and track progress visually.
